Wind Resource Assessment and Mapping for Afghanistan and Pakistan

Dennis Elliott

National Renewable Energy Laboratory
### Golden, Colorado USA

1

Benefits of Detailed, Regional Wind Mapping

- Accelerate identification of promising areas for wind prospecting and project development
- Facilitate investment in large-scale wind energy projects
- Support informed decision-making by public and private sectors
- Accelerate the wind project deployment process

NREL's High-Resolution Wind Mapping Approach

- Computerized mapping approach using Geographical Information System (GIS) software (ArcInfo® and ArcView®)
- Designed for regional wind mapping (not micrositing)
- Combination of numerical, empirical and analytical methods
- Does not depend on high-quality surface wind data (but it helps)
- Produces 1 km^2 or finer wind power maps

NREL's wind mapping projects have been supported primarily by:

U.S. Department of Energy
U.S. Agency for International Development
United Nations Environment Programme.

CHILE

High-resolution (1 km² or finer) regional or national wind resource maps have been produced or are in progress for:

Afghanistan	El Salvador	Mongolia
Armenia	Ghana	Nicaragua
Belize	Guatemala	Pakistan
Chile - specific areas	Honduras	Philippines
China - specific areas	Indonesia - specific areas	Russia - specific areas
Cuba	Maldives	Sri Lanka
Dominican Republic	Mexico - specific areas	United States - specific areas

U.S. Department of Energy

Afghanistan and Pakistan Wind Mapping
Project Responsibilities

- NREL
    - project coordination
    - data collection and analysis
    - review and validation of preliminary wind maps from numerical modeling
    - final map development and resource characterization
    - documentation

- 3TIER Environmental Forecast Group (subcontractor to NREL)
    - numerical modeling to produce preliminary wind map estimates

- Country Organizations
    - collection of data from in-country sources
    - data sent to NREL for review and use in the assessment

# Major Global Data Sets used by NREL for Wind Resource Assessment

Data Set	Type of Information	Source	Period of Record
Surface Station Data	Surface observations more than 20000 stations	NOAA/NCDC	Variable up to 2006
Upper Air Station Data	Rawinsonde and pibal observations at 1800 stations	NCAR	1973-2005
Satellite-derived Ocean Wind Data	10-m ocean wind speeds gridded to 0.25 deg	NASA/JPL	1988-2006
Marine Climatic Atlas of the World	Gridded (1.0 deg) statistics of historical ship wind observations	NOAA/NCDC	1854-1969
Reanalysis Upper Air Data	Model-derived gridded (~200km) upper air data	NCAR	1958-2005
Global Upper Air Climatic Atlas	Model-derived gridded (2.5 deg) upper air statistics	NOAA/NCDC	1980-1991
Digital Geographic Data	Political, hydrography, etc.	ESRI	
Digital Terrain Data	Elevation – 1 km resolution	USGS/EROS	
Digital Land Cover Data	Land use/cover and tree cover density – 0.5 km resolution	NASA/USGS	

NREL's SARI-Energy Activities

Numerical Modeling Method
Afghanistan and Pakistan Wind Mapping

- ## Model Design and Outputs
  - Modeling system created by 3TIER (U.S. company based in Seattle, WA)
  - A numerical weather model (WRF) coupled to a wind flow model (CALMET) and global weather, topographical, and land cover data
  - NCEP/NCAR Reanalysis (200-km grid) - most important global weather input for WRF
  - WRF simulates weather conditions (including winds) over 365 days selected from a 15-year period
  - WRF simulations to 2.5 km and CALMET simulations to 1 km
  - Model output grids provided to NREL for review and improvement with empirical and analytical methods

Data Analysis for Assessment and Validation –
Surface, Upper-Air, Reanalysis, and Satellite Ocean Data
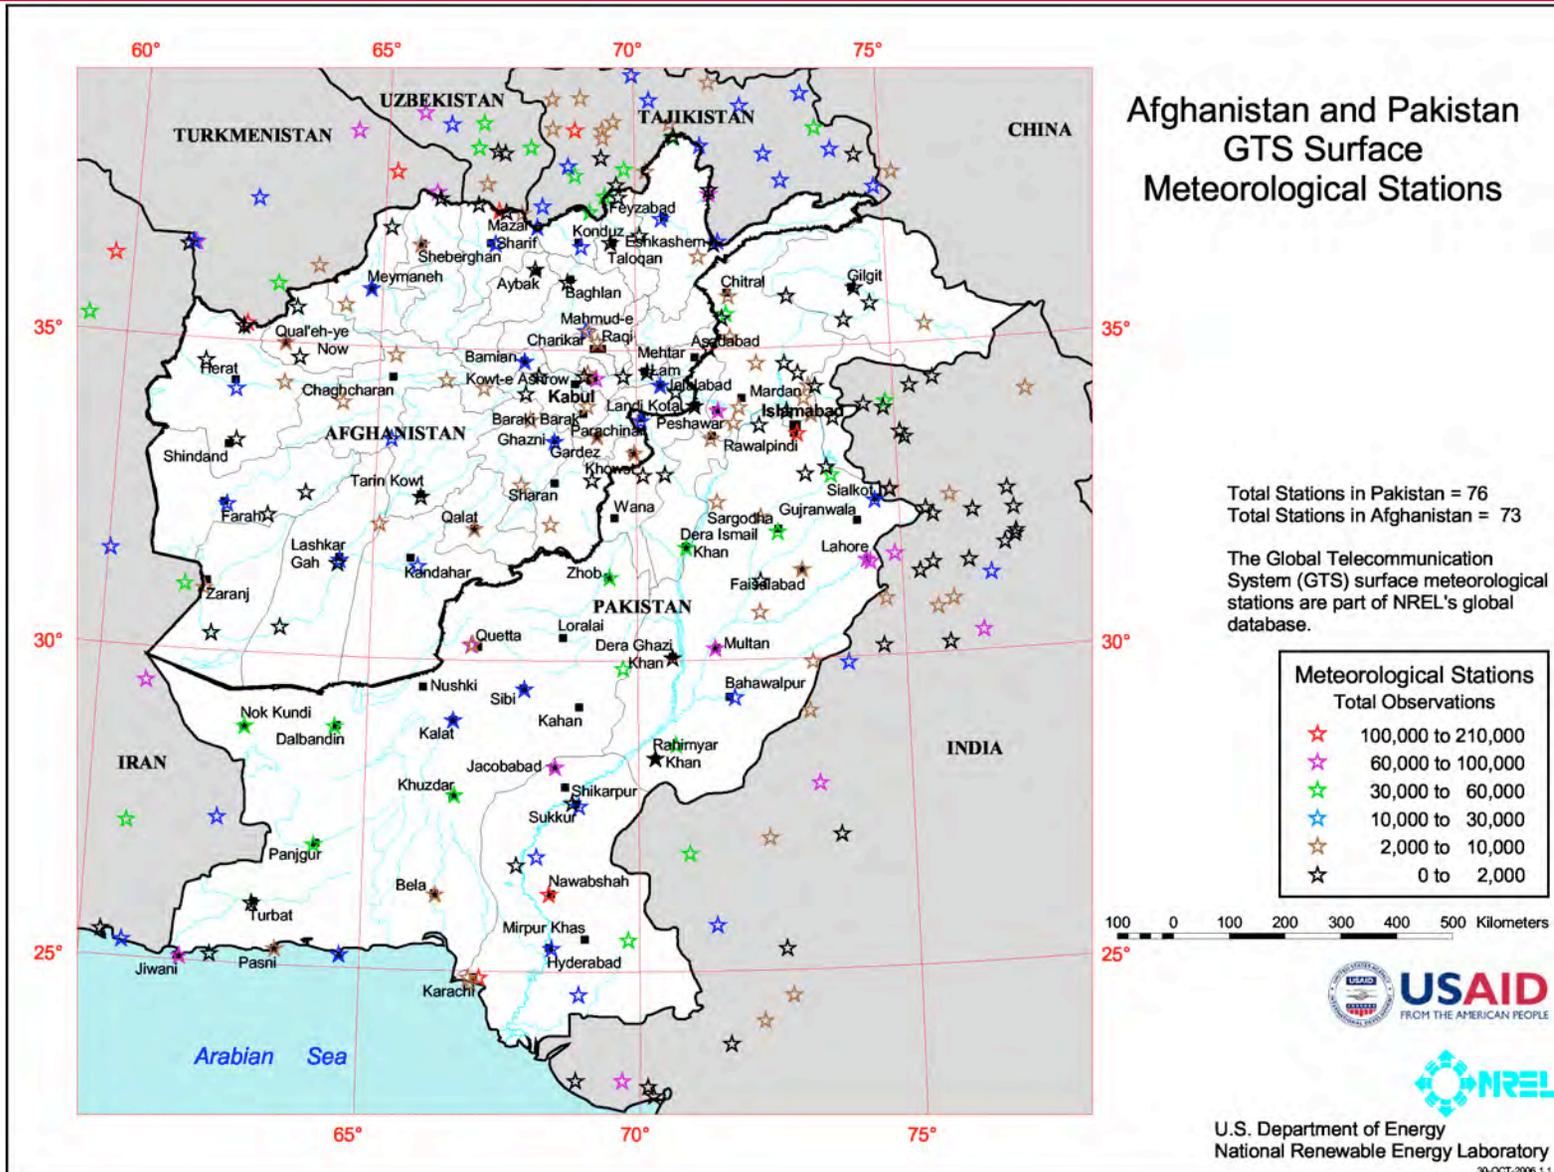

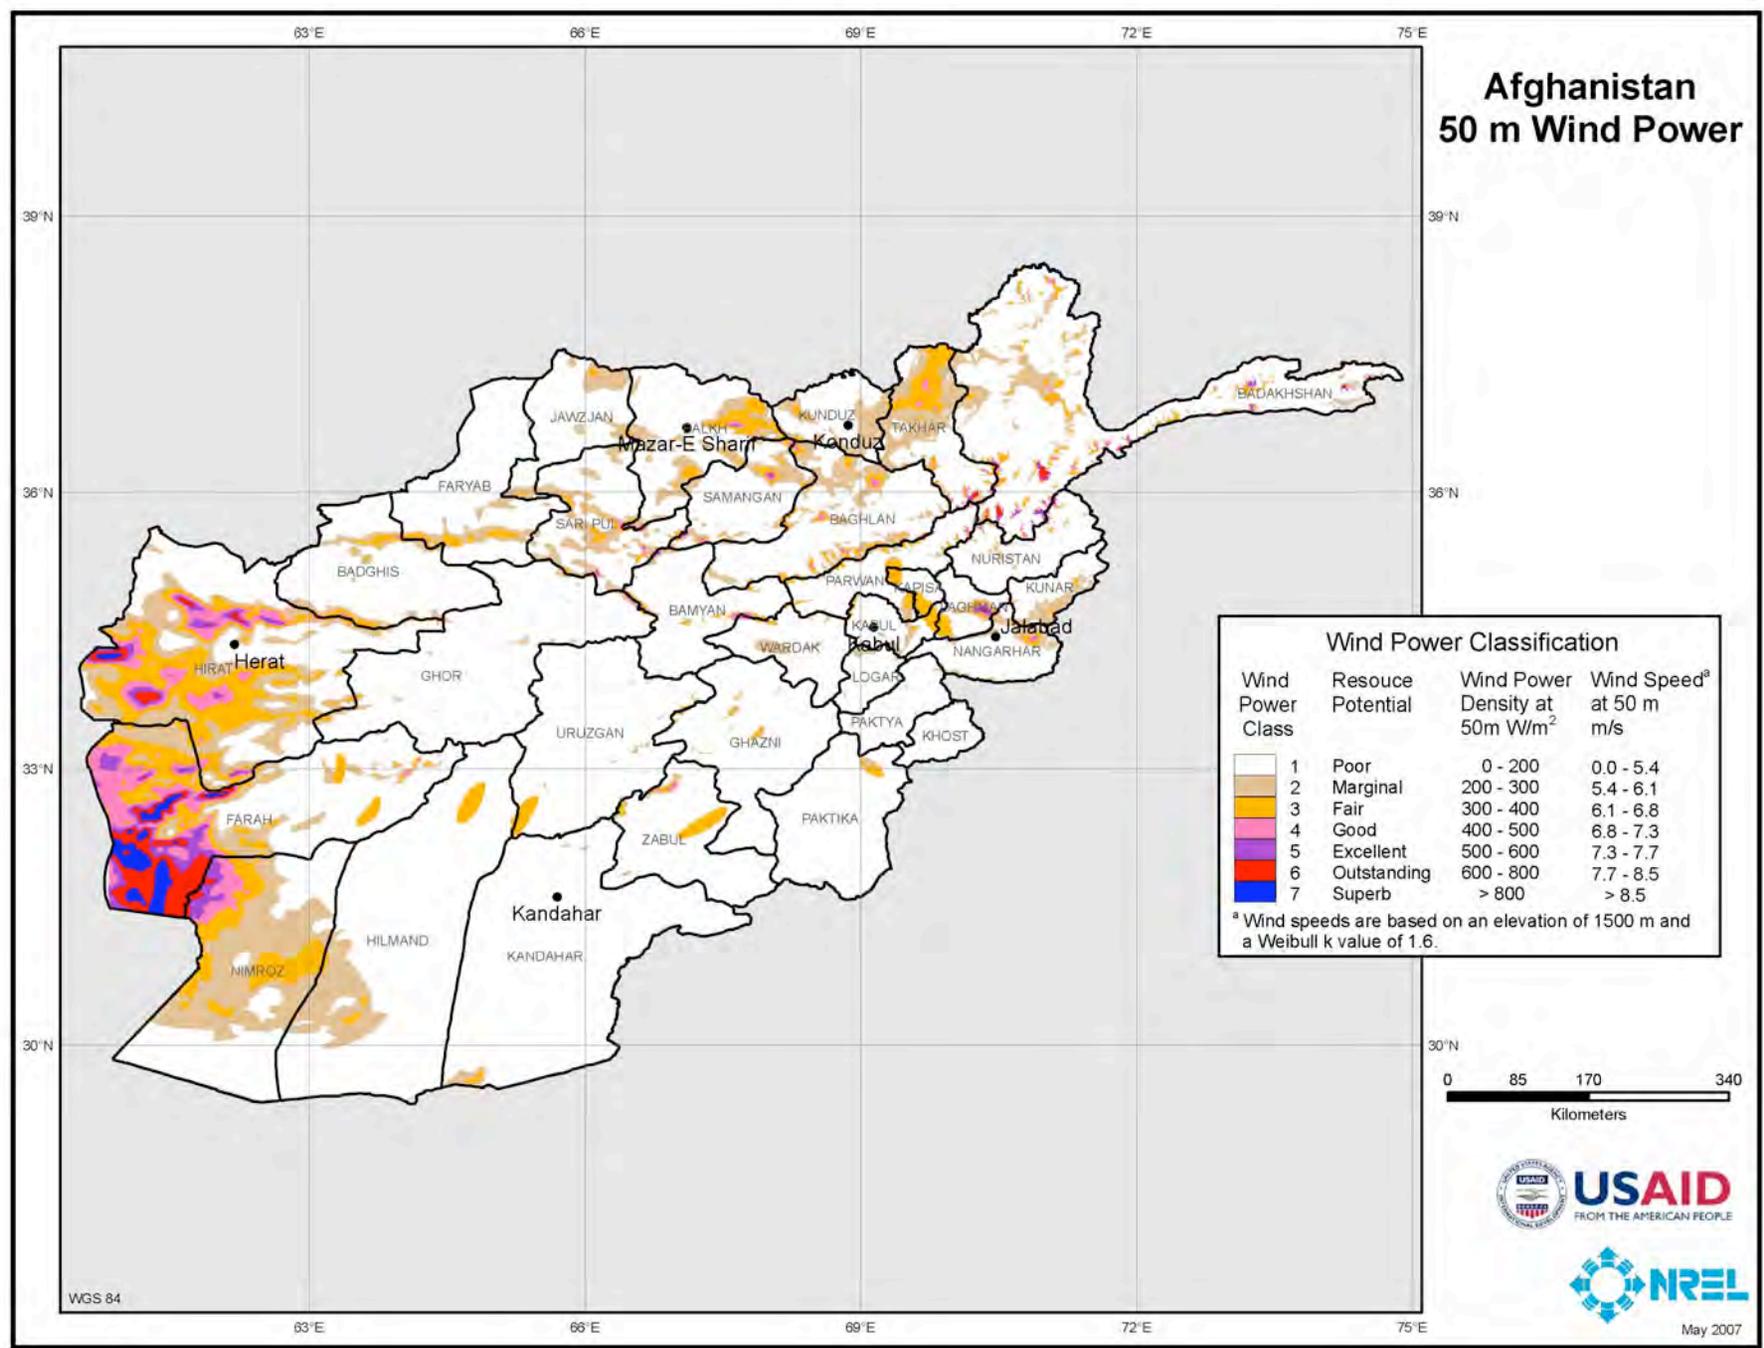

Recent Wind Measurements in Pakistan
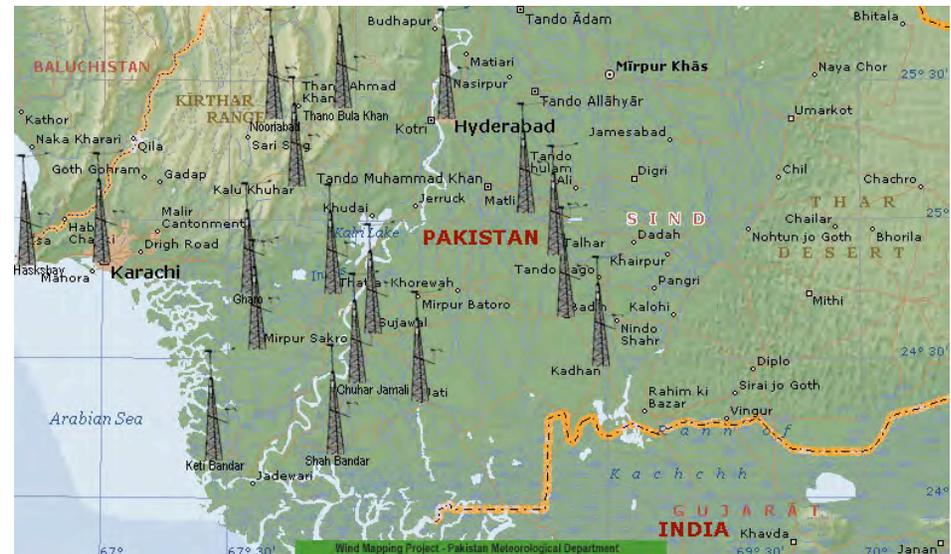

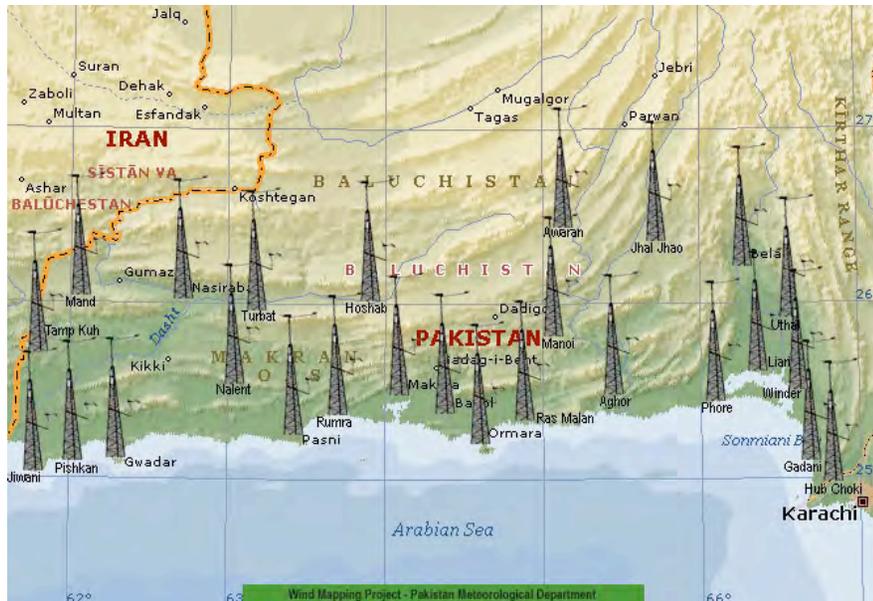

- Wind measurement data from 47 towers in southern Pakistan are being analyzed for the assessment.

NREL's SARI-Energy Activities

Key Deliverables
Afghanistan and Pakistan Wind Mapping

- High resolution annual wind power maps, with documentation, for distribution:
  - estimates for 50-m height above ground
  - horizontal spatial resolution: 1-km grid
- Electronic data sets, including
  - the modified and raw gridded map data in GIS format
  - other products including summaries of processed data from available wind measurement stations
- Presentation of project results to country partners and stakeholders from throughout the region

Afghanistan's Wind Resources
Major Areas

- Major wind resource areas
  - Western Afghanistan especially
    - Northwestern Nimroz
    - Western Farah
    - Western Herat
  - Northeastern areas especially
    - Eastern Balkh
    - Northern Takhar
  - Wind corridor areas including
    - Near Jabalsaraj, Sarobi, and Tirgari in eastern Afghanistan
    - Near Qalat, Gadamsar, Walakhor, Golestan, and Gorzanak in central/southern Afghanistan
  - Elevated mountain summits and ridge crests especially in northern and eastern Afghanistan

AFGHANISTAN - WIND ELECTRIC POTENTIAL
Good-to-Excellent Wind Resource at 50 m (Utility Scale)

Wind Resource Utility Scale	Wind Class	Wind Power W/m^2	Wind Speed m/s	Land Area km^2	Percent Windy Land	Total Capacity Installed MW
Good	4	400 - 500	6.8 – 7.3	15,193	2.4	75,970
Excellent	5	500 - 600	7.3 – 7.7	6,633	1.0	33,160
Excellent	6	600 - 800	7.7 – 8.5	6,615	1.0	33,100
Excellent	7	> 800	> 8.5	3,169	0.5	15,800
Total				31,611	4.9	158,100

Assumptions
Installed capacity per km^2 = 5 MW
Total land area of Afghanistan = 645,810 km^2

NREL's SARI-Energy Activities

Conclusions for Afghanistan Wind Mapping

- Advanced modeling and analysis techniques employed to produce detailed wind resource maps of Afghanistan
- High resolution wind maps and assessment information
  - Useful to identify best prospective areas and screen out less promising areas, minimizing cost and time of prospecting
  - Does not eliminate the need for on-site wind measurement
- Windy land area and theoretical wind potential estimates
  - Class 4+ (good-to-excellent for utility-scale applications)
    - 31,600 sq km, almost 5% of Afghanistan's total land area (650,000 sq km)
    - 158,000 MW of potential installed wind capacity (assumes 5 MW/sq km)
  - Good potential for many wind/diesel and off-grid applications
    - Almost 12% of Afghanistan's land area has Class 3 or better wind resource

Pakistan's Wind Resources
Major Areas

- Major wind resource areas
  - Southeastern Pakistan especially
    - Hyderabad to Gharo region in southern Indus Valley
    - Coastal areas south of Karachi
    - Hills and ridges between Karachi and Hyderabad
  - Northern Indus Valley especially
    - Hills and ridges in northern Punjab
    - Ridges and wind corridors near Mardan and Islamabad
  - Southwestern Pakistan especially
    - Near Nokkundi and hills and ridges in the Chagai area
    - Makran area hills and ridges
  - Central Pakistan especially
    - Wind corridors and ridges near Quetta
    - Hills near Gendari
  - Elevated mountain summits and ridge crests especially in northern Pakistan

NREL's SARI-Energy Activities

PAKISTAN - WIND ELECTRIC POTENTIAL
Good-to-Excellent Wind Resource at 50 m (Utility Scale)

Wind Resource Utility Scale	Wind Class	Wind Power W/m^2	Wind Speed m/s	Land Area km^2	Percent Windy Land	Total Capacity Installed MW
Good	4	400 - 500	6.9 – 7.4	18,106	2.1	90,530
Excellent	5	500 - 600	7.4 – 7.8	5,218	0.6	26,090
Excellent	6	600 - 800	7.8 – 8.6	2,495	0.3	12,480
Excellent	7	> 800	> 8.6	543	0.1	2,720
Total				26,362	3.0	131,800

Assumptions
Installed capacity per km^2 = 5 MW
Total land area of Pakistan = 877,525 km^2
Only land area included in calculations

Conclusions for Pakistan Wind Mapping

- ## Advanced modeling and analysis techniques employed to produce detailed wind resource maps of Pakistan
- ## High resolution wind maps and assessment information
  - Useful to identify best prospective areas and screen out less promising areas, minimizing cost and time of prospecting
  - Does not eliminate the need for on-site wind measurement
- ## Windy land area and theoretical wind potential estimates
  - Class 4+ (good-to-excellent for utility-scale applications)
    - 26,400 sq km, about 3% of Pakistan's total land area (800,000 sq km)
    - 132,000 MW of potential installed wind capacity (assumes 5 MW/sq km)
  - Good potential for many wind/diesel and off-grid applications
    - Almost 9% of Pakistan's land area has Class 3 or better wind resource
